Phase 2 - Logon & Authentication

Recall + Wazuh Mapping Sheet • 14 events

PART A - RECALL QUIZ (from memory, then verify)

All 14 - say the meaning AND why a SOC analyst cares

4624 successful logon / SOC cares: every logon is a door opening - who logged on, from where, what type; a privileged account logging on at 3am from an unknown IP is the first sign of a breach

4625 failed logon / SOC cares: one failure is a typo, many failures is a brute-force attack in progress - a sudden burst against one account means someone is guessing passwords right now

4634 logoff, session ended / SOC cares: pairs with 4624 to show how long a session lasted - a session that ends seconds after logon, or never ends, tells you what happened in between

4647 user-initiated logoff / SOC cares: the user chose to log off - different from a session dying on its own; if a user logs off right after a privileged action, check what they did in between

4648 logon with explicit credentials, RunAs or a second account / SOC cares: someone used a second set of credentials - legit for admins, but an attacker uses RunAs to step up to a privileged account without logging off

4672 special privileges assigned to a new logon / SOC cares: this is the admin-logon flag - when a privileged account logs on, this fires; an attacker logging on as admin lights this up, so watch it

4768 Kerberos TGT requested / SOC cares: the first step of Kerberos auth - a TGT request from an unusual host or for a privileged account is the start of ticket-based attacks

4769 Kerberos service ticket requested / SOC cares: a ticket to a specific service - bulk 4769s to many services is Kerberoasting or lateral movement in progress

4771 Kerberos pre-authentication failed / SOC cares: wrong password against Kerberos - repeated 4771s mean password guessing, and the account still locks out even when the events are invisible without the right audit subcategory

4776 credential validation, NTLM / SOC cares: NTLM auth happened - NTLM is weaker than Kerberos, so a spike in 4776s can mean pass-the-hash or legacy auth abuse

4778 session reconnected, RDP / SOC cares: someone reconnected to a disconnected RDP session - an attacker reconnecting to a victim's session takes over their desktop without a fresh logon

4779 session disconnected, RDP / SOC cares: the RDP session was left hanging - a disconnected session is still live on the server and can be reconnected by anyone who reaches it

4800 workstation locked / SOC cares: the user locked their screen - a lock right after a sensitive action can mean the user walked away mid-task, or someone else locked it

4801 workstation unlocked / SOC cares: someone unlocked the workstation - if the unlock does not match the user's normal pattern, check who sat at that keyboard

All 14 events in order - one-line meaning each

- [ ] 4624 - Successful logon
- [ ] 4625 - Failed logon
- [ ] 4634 - Logoff (session ended)
- [ ] 4647 - User-initiated logoff
- [ ] 4648 - Logon with explicit credentials (RunAs)
- [ ] 4672 - Special privileges assigned to new logon
- [ ] 4768 - Kerberos TGT requested
- [ ] 4769 - Kerberos service ticket requested
- [ ] 4771 - Kerberos pre-authentication failed
- [ ] 4776 - Credential validation (NTLM)
- [ ] 4778 - Session reconnected (RDP)
- [ ] 4779 - Session disconnected (RDP)
- [ ] 4800 - Workstation locked
- [ ] 4801 - Workstation unlocked

PART B - WAZUH MAPPING TABLE

Generate each event -> find the alert in Threat Hunting -> read the rule ID off the fired alert.

Event	Meaning	Wazuh rule	Level	Verdict
4624	Successful logon			
4625	Failed logon			
4634	Logoff (session ended)			
4647	User-initiated logoff			
4648	Logon with explicit credentials (RunAs)			
4672	Special privileges assigned to new logon			
4768	Kerberos TGT requested			
4769	Kerberos service ticket requested			
4771	Kerberos pre-authentication failed			
4776	Credential validation (NTLM)			
4778	Session reconnected (RDP)			
4779	Session disconnected (RDP)			
4800	Workstation locked			
4801	Workstation unlocked			

PHASE 1 DONE = all of this

- [ ] Part A: all 14 events recalled cold (meaning + why a SOC analyst cares), all 14 meanings memorized in order
- [ ] Part B: all 14 rows filled - every event has a rule ID + level, or is marked GAP
- [ ] One-line verdict per event: covered / needs tuning / gap
